FINAL YEAR PROJECT PROPOSAL

HostelFinder — Smart Hostel Search and Management App

Student Name	Ayesha Bari
Roll Number	F23BINFT1E02202
Submitted To	Abdul Karim Nawaz

Project Title

HostelFinder — Smart Hostel Search and Management App

Project Brief

HostelFinder is a mobile application designed to help students find suitable hostels near their university, college, or current location. Students who are unable to find hostel accommodation can use this public application to search for nearby hostels according to their budget, distance, facilities, and personal requirements.

The application will provide detailed information about each hostel, including photographs, location, monthly rent, room types, available facilities, security arrangements, food availability, Wi-Fi, laundry, and room availability. Students will be able to compare different hostels, view their locations on a map, save their favourite options, and send enquiries or booking requests.

Hostel owners will be able to register their hostels, add details, upload photographs, and update room availability. An administrator can review hostel listings to improve the reliability of the information.

The main objective of HostelFinder is to make hostel searching easier, faster, and more convenient by helping students find accommodation that matches their needs and preferences.

Technologies

Technology	Purpose
Flutter	Developing the mobile application.
Firebase Authentication	Student and hostel-owner registration and login.
Cloud Firestore	Storing hostel details, facilities, prices, and booking requests.
Firebase Storage	Storing hostel photographs.
Google Maps SDK	Displaying hostel locations and helping students find nearby hostels.

Prepared for discussion and approval by the project supervisor.
